# Highlights: phase-space models for zonal flow dynamics

- Traditional wave kinetic equation (tWKE):
  - derived based on over-simplifications;
  - fails to properly capture the zonostrophic instability (ZI).
- Improved wave kinetic equation (iWKE):
  - systematically derived geometrical-optics (GO) model;
  - semi-quantitatively captures ZI;
  - does not show zonal flow (ZF) oscillations or deterioration.
- Full-wave (Wigner–Moyal, WM) model:
  - no GO (ray) approximation, subsumes iWKE;
  - produces ZF oscillations and deterioration.

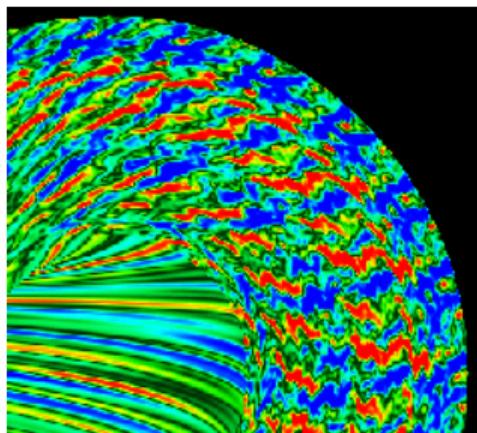

# Outline

- 1 Motivation: zonal flows and wave kinetics
- 2 Tutorial: quantum mechanics (wave physics) in phase space
- 3 Models: phase-space models for zonal flow dynamics
- 4 Results: simulations with different models

# Zonal flows in nature

Magnetized plasmas  
(PC: GYRO team)

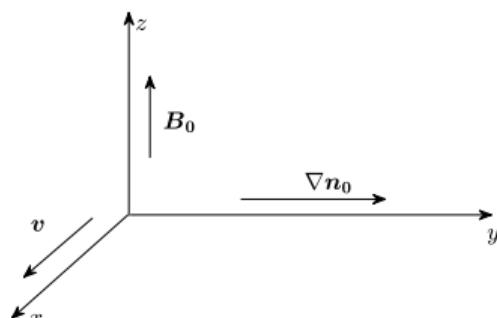

Jupiter atmosphere  
(PC: NASA Cassini)

# Generalized Hasegawa-Mima equation (gHME)

- Standard HME (in normalized units)

$$\partial_t w + \mathbf{v} \cdot \nabla w + \beta \partial_x \varphi = f - D, \quad (1)$$

with  $\mathbf{v} = \hat{\mathbf{z}} \times \nabla \varphi$ , and generalized vorticity

$$w = (\nabla^2 - \hat{a})\varphi. \quad (2)$$

$\hat{a} = 1$  for drift waves (DWs);  $\hat{a} = 0$  for ZFs<sup>1</sup>.

- Conserves enstrophy and energy (when  $f, D = 0$ ):

$$Z = \frac{1}{2} \int d^2x w^2, E = -\frac{1}{2} \int d^2x w\varphi. \quad (3)$$

<sup>1</sup>G. W. Hammett et al., Plasma Phys. Control. Fusion 35, 973 (1993).

# Traditional wave kinetic equation (tWKE)

- Particle-field system<sup>2</sup>:

- DWs as quasi-particles (driftons). Liouville equation

$$\partial_t W = \{\mathcal{H}, W\}, \quad (4)$$

$W$ : “Wigner function”;  $\mathcal{H}$ : Hamiltonian (dispersion).

- ZF velocity as a field.
- Intuitive and statistical derivative from gHME.
- Questionable features:
  - Small-scale ZFs observed in tWKE simulations<sup>3</sup>.
  - Conserves DW enstrophy, **not** total enstrophy.
- Warrants **systematic** re-examination and re-derivation.

# Outline

- 1 Motivation: zonal flows and wave kinetics
- 2 Tutorial: quantum mechanics (wave physics) in phase space
- 3 Models: phase-space models for zonal flow dynamics
- 4 Results: simulations with different models

# Weyl symbol and Moyal product

- Weyl transform: from (Hermitian) operator  $\hat{A}$  in Hilbert space to (real) function  $A(\mathbf{x}, \mathbf{p})$  (Weyl symbol) in phase space,

$$A(\mathbf{x}, \mathbf{p}) = \int d^n s e^{-i\mathbf{p}\cdot\mathbf{s}} \langle \mathbf{x} + \hbar\mathbf{s}/2 | \hat{A} | \mathbf{x} - \hbar\mathbf{s}/2 \rangle. \quad (5)$$

- Operator product  $\hat{C} = \hat{A}\hat{B}$  becomes Moyal product

$$C(\mathbf{x}, \mathbf{p}) = A(\mathbf{x}, \mathbf{p}) \star B(\mathbf{x}, \mathbf{p}) \doteq A(\mathbf{x}, \mathbf{p}) \exp(i\hbar\hat{\mathcal{L}}/2)B(\mathbf{x}, \mathbf{p}), \quad (6a)$$

$$\hat{\mathcal{L}} \doteq \overleftarrow{\partial_{\mathbf{x}}} \cdot \overrightarrow{\partial_{\mathbf{p}}} - \overleftarrow{\partial_{\mathbf{p}}} \cdot \overrightarrow{\partial_{\mathbf{x}}} = \{\cdot, \cdot\}. \quad (6b)$$

- Commutators become Moyal brackets

$$\hbar\{\{A, B\}\} \doteq -i(A \star B - B \star A) = 2A \sin(\hbar\hat{\mathcal{L}}/2)B, \quad (7a)$$

$$[[A, B]] \doteq A \star B + B \star A = 2A \cos(\hbar\hat{\mathcal{L}}/2)B. \quad (7b)$$

# Wigner function and time evolution

- Schrödinger equation, (for classical waves:  $\hbar \rightarrow \epsilon$ , the GO parameter)

$$i\hbar\partial_t |\psi\rangle = \hat{H} |\psi\rangle. \quad (8)$$

- von Neumann equation, (density operator  $\hat{\rho} \doteq |\psi\rangle\langle\psi|$ )

$$i\hbar\partial_t \hat{\rho} = \hat{H}\hat{\rho} - \hat{\rho}\hat{H}. \quad (9)$$

- Wigner function  $W$  (Weyl symbol of  $\hat{\rho}$ ) satisfies WM equation<sup>4,5</sup>,

$$\partial_t W = \{\{H, W\}\}. \quad (10)$$

- Classical (GO) limit,  $\hbar, \epsilon \rightarrow 0$ : Liouville (wave kinetic) equation,

$$\partial_t W \simeq H\hat{\mathcal{L}}W = \{H, W\}. \quad (11)$$

# Outline

- 1 Motivation: zonal flows and wave kinetics
- 2 Tutorial: quantum mechanics (wave physics) in phase space
- 3 Models: phase-space models for zonal flow dynamics
- 4 Results: simulations with different models

# Quasilinear approximation (standard)

- Zonal average  $\bar{g} \doteq \int dx g/L_x$ ,  $w = \bar{w} + \tilde{w}$ ,  $\bar{w} = -\partial_y U$ ,

$$\partial_t \tilde{w} + U \partial_x \tilde{w} + (\beta - U'') \partial_x \tilde{\varphi} + f_{NL} = 0, \quad (12a)$$

$$\partial_t U + \partial_y \overline{\tilde{v}_x \tilde{v}_y} = 0. \quad (12b)$$

- Neglecting eddy-eddy interaction  $f_{NL} \doteq \tilde{\mathbf{v}} \cdot \nabla \tilde{w} - \overline{\tilde{\mathbf{v}} \cdot \nabla \tilde{w}}$ ,

$$i\partial_t |\tilde{w}\rangle = \hat{H} |\tilde{w}\rangle, \quad (13)$$

with a **non-Hermitian** Hamiltonian, ( $\hat{p}_D^2 \doteq \hat{p}_x^2 + \hat{p}_y^2 + 1$ )

$$\hat{H} = (\hat{U}'' - \beta) \hat{p}_x \hat{p}_D^{-2} + \hat{U} \hat{p}_x. \quad (14)$$

- Total energy and enstrophy still conserved.

# Wigner-Moyal formulation: full-wave model

- (Zonal averaged) WM equations<sup>8</sup>,

$$\partial_t W = \{\{H, W\}\} + [[\Gamma, W]], \quad (15a)$$

$$\partial_t U = \partial_y \int \frac{d^2 p}{(2\pi)^2} \frac{1}{p_D^2} \star p_x p_y W \star \frac{1}{p_D^2}, \quad (15b)$$

with  $W = W(t, y, \mathbf{p})$ , and

$$H = -\beta p_x / p_D^2 + p_x U + [[U'', p_x / p_D^2]]/2, \quad (16a)$$

$$\Gamma = \{\{U'', p_x / p_D^2\}\}/2. \quad (16b)$$

- Total energy and enstrophy still conserved.

<sup>8</sup>D. E. Ruiz et al., Phys. Plasmas 23, 122304 (2016).

# GO limit: iWKE, not tWKE

- iWKE obtained in the GO limit [ $\lambda_{\text{ZF}} \gg \max(\lambda_{\text{DW}}, 1)$ ],

$$\partial_t W = \{\mathcal{H}, W\} + 2\Gamma W, \quad (17a)$$

$$\partial_t U = \partial_y \int \frac{d^2 p}{(2\pi)^2} \frac{p_x p_y}{p_D^4} W, \quad (17b)$$

with

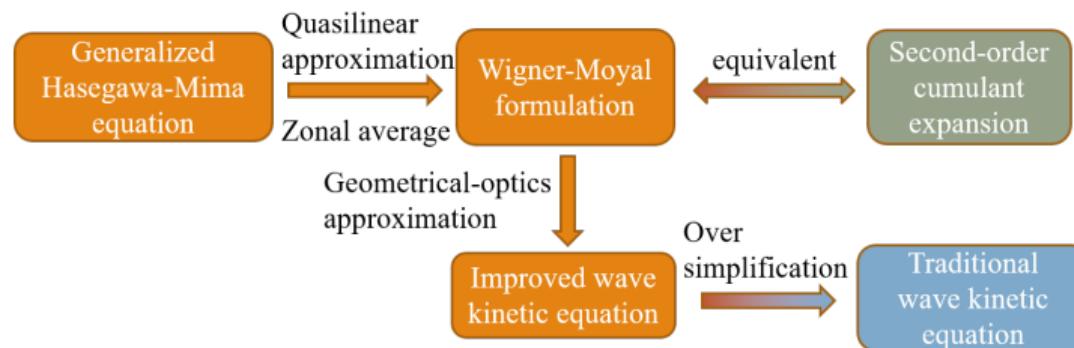

$$\mathcal{H} = (U'' - \beta) p_x / p_D^2 + p_x U, \quad \Gamma = -U''' p_x p_y / p_D^4. \quad (18)$$

- Total energy and enstrophy still conserved.
- In contrast, for tWKE,

$$\mathcal{H} = -\beta p_x / p_D^2 + p_x U, \quad \Gamma = 0. \quad (19)$$

- Total enstrophy **no longer** conserved.

# Summary: hierarchy of models

- Second-order cumulant expansion<sup>9</sup> (CE2):
  - popular in geophysics;
  - correlation function: density matrix, in double-configuration space;
  - equivalent to WM, yet less intuitive.

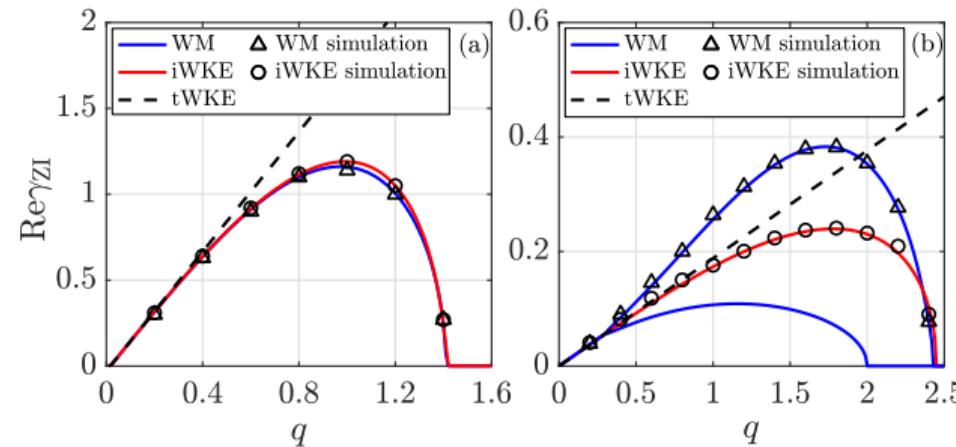

<sup>9</sup>J. B. Parker, PhD thesis (Princeton University, 2014).

# Outline

- 1 Motivation: zonal flows and wave kinetics
- 2 Tutorial: quantum mechanics (wave physics) in phase space
- 3 Models: phase-space models for zonal flow dynamics
- 4 Results: simulations with different models

# tWKE: ultraviolet catastrophe

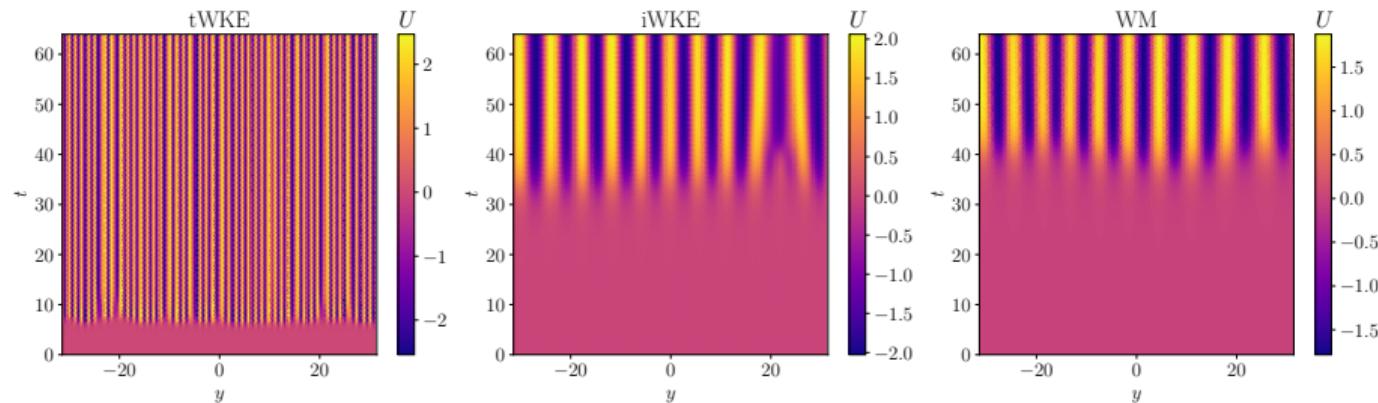

- For linear zonostrophic (secondary) instability (ZI):
  - tWKE dispersion **diverges** at high  $q$  (ZF wave number)<sup>10</sup>;
  - iWKE and WM dispersions truncate at finite  $q$ ;
  - iWKE captures WM results semi-quantitatively;
  - fastest-growing modes:  $q \sim 1$ , GO approximation questionable.

<sup>10</sup>J. B. Parker, J. Plasma Phys. 82, 595820602 (2016).

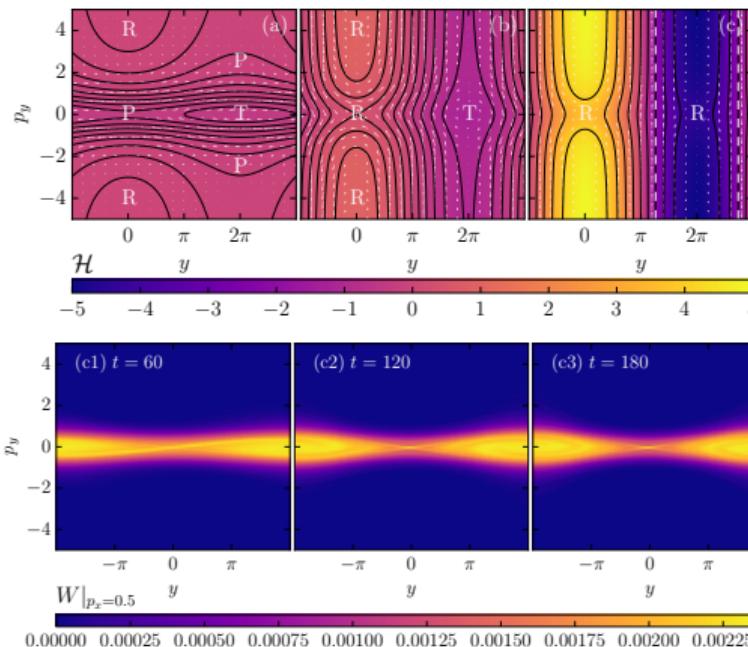

# Nonlinear ZI: tWKE fails

- For nonlinear ZI (with forcing & dissipation):
  - tWKE: unphysical grid-scale ZFs.
  - iWKE & WM: ZFs with finite wave number  $q \sim 1$ .
- When do **full-wave** effects become significant?

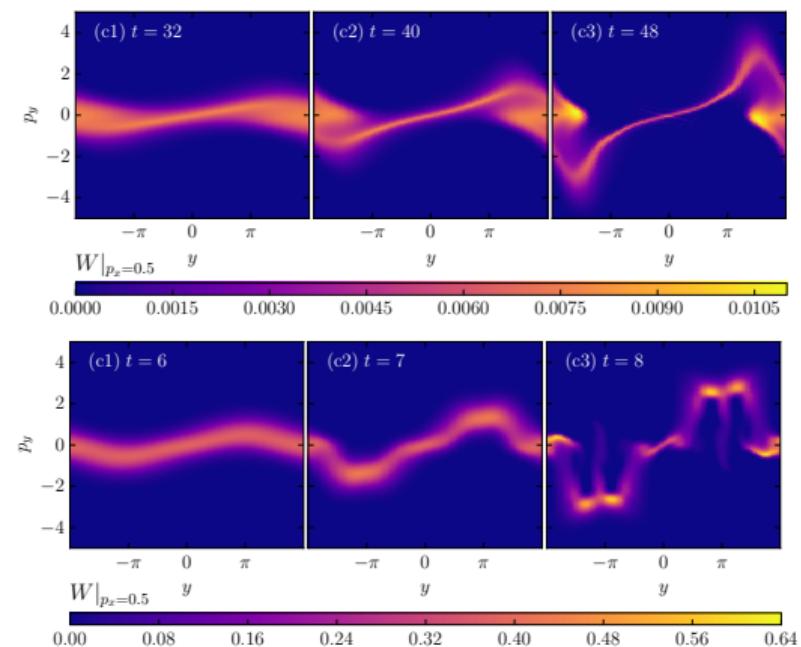

# iWKE: driftion trajectories imply ZF saturation

Phase space structures

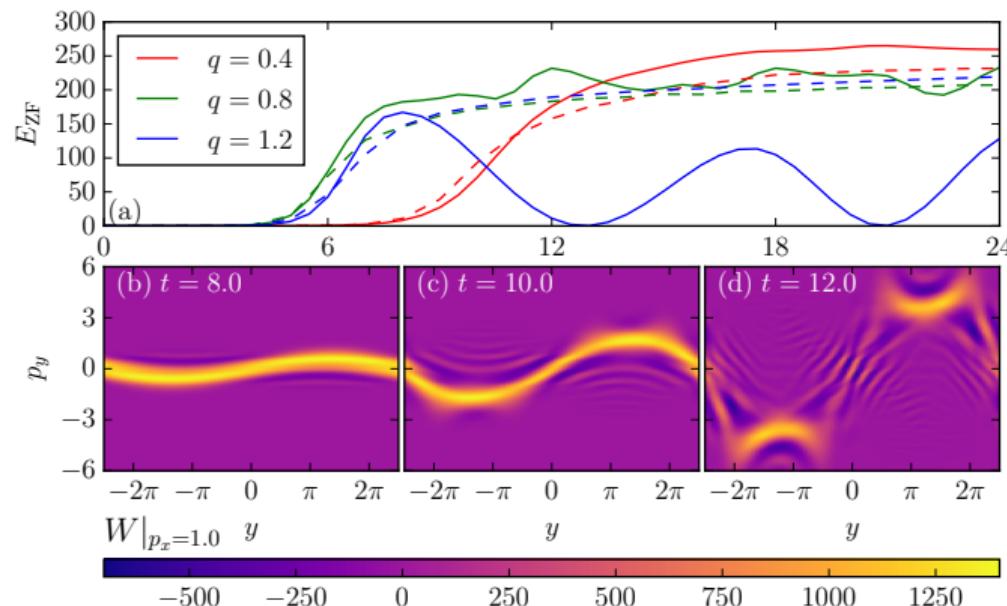

Nonlinear ZI (w/o forcing &amp; dissipation)

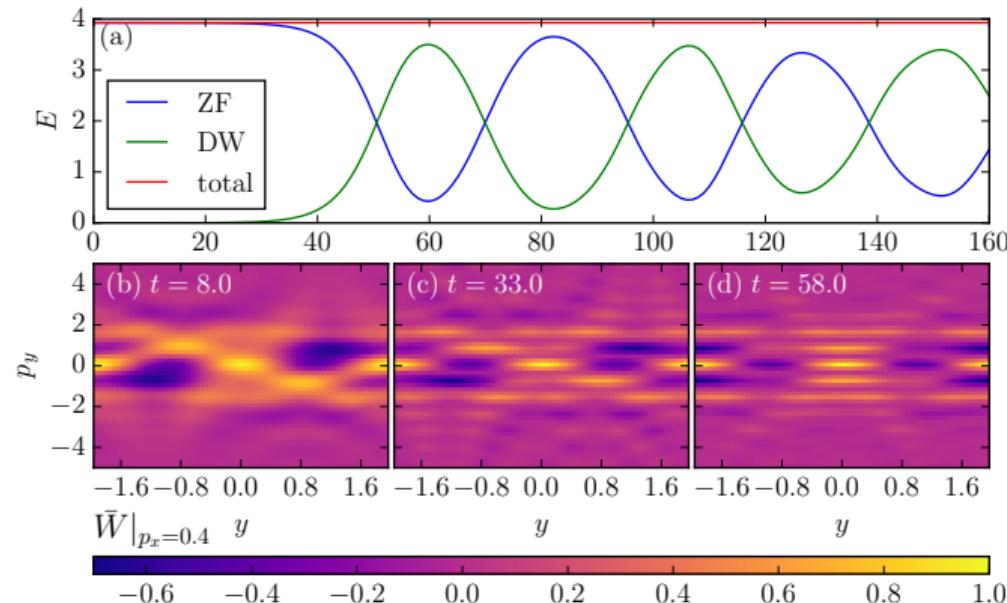

# Full-wave effect: ZF oscillations

- In contrast, WM simulations show ZF oscillations for large  $q$ .
- iWKE no longer applicable for large  $q$ .

# Tertiary instability: ZF deterioration

- (Strong) ZFs with large  $q$  are unstable to DW perturbations.
  - Rayleigh–Kuo criterion<sup>11</sup>:  $U'' = \beta$  somewhere (necessary condition).
- Nonlinearly, DW and ZF show predator-prey type oscillation.

<sup>11</sup>H.-L. Kuo, J. Meteor. 6, 105 (1949).

# Summary & outlook

- Traditional wave kinetic equation (tWKE, **caution!**):
  - over-simplified;
  - does not properly capture ZI.
- Improved wave kinetic equation (iWKE, **OK**):
  - systematically derived GO model;
  - semi-quantitatively captures ZI;
  - no ZF oscillation or deterioration.
- Full-wave (Wigner–Moyal, WM) model (**better**):
  - no ray approximation, subsumes iWKE;
  - shows ZF oscillation or deterioration.
- Future work:
  - analytical reduced model for predator-prey oscillation?
  - beyond quasilinear approximation<sup>12</sup>: eddy-eddy interaction?
  - more sophisticated parent model: Hasegawa–Wakatani?
- Details: [H. Zhu et al., arXiv:1712.08262 (2017).]
